

Science Behind Creative Writing: How the City Girls Came Up with Jobs

Mellany Andrea Quiroz Almendarez, CSE 185, UCSC

Introduction

Creative writing requires the use of specific parts of the brain. By explaining this phenomenon, we can understand how the City Girls produce their lyrics.

PERIOD

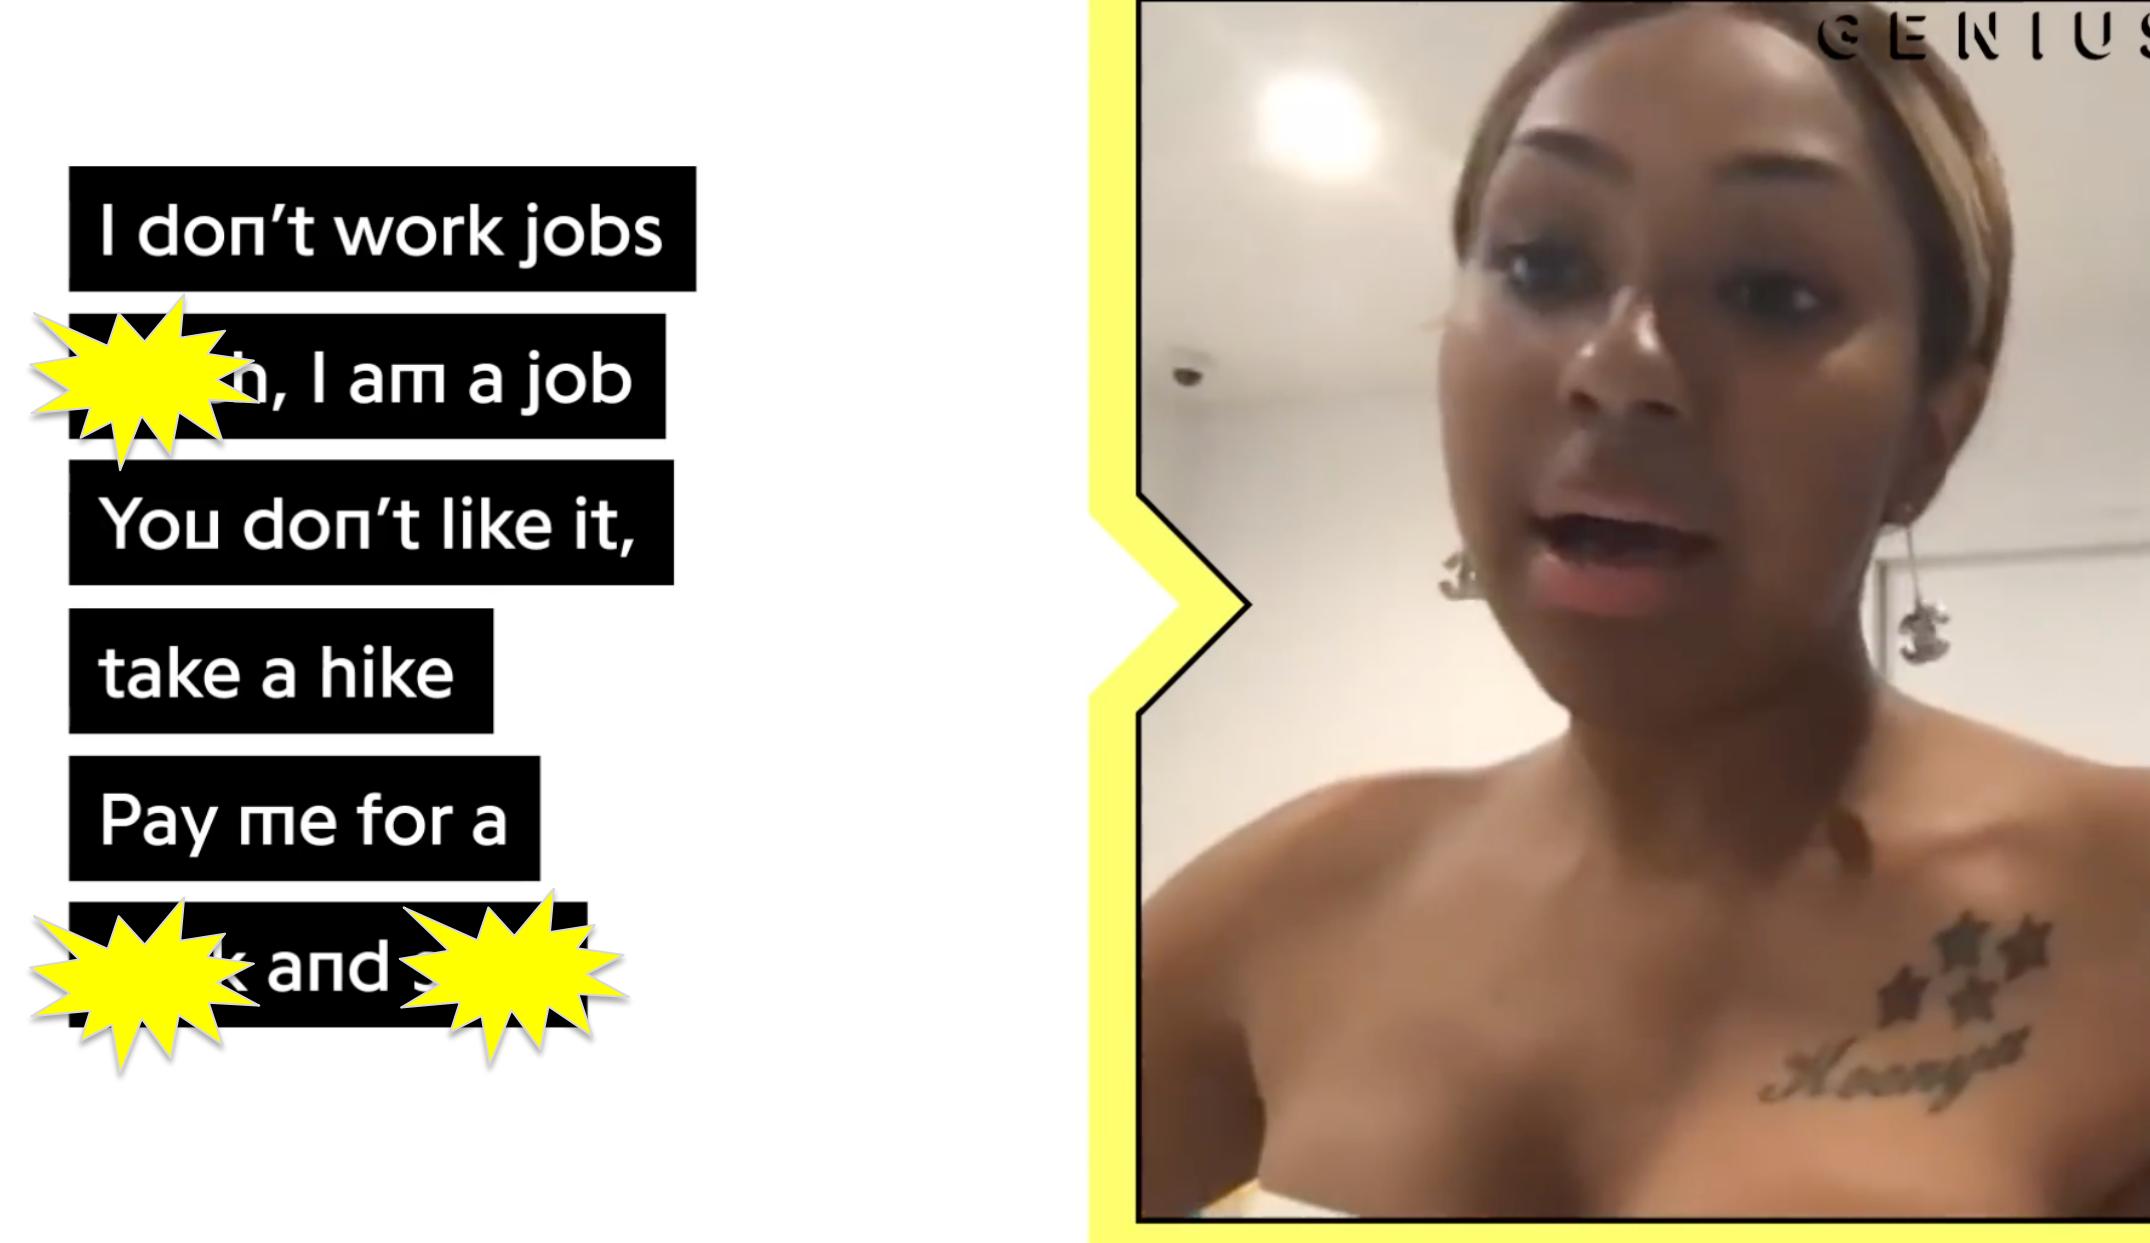

The Brain and Creativity

Recent work has shown that when participants were asked to recall episodic memories in high degree of detail, those who produced them with more ideas were more diverse with creativity. When explaining her thought process of writing her verses, Yung Miami displays this way of thinking.

Why Only Some?

Analysis has shown stronger functional connections between the default, control, and salience networks (a network involved in switching between the default and control networks) in highly creative people. Can we boost this?

How does this relate to City Girls' Writing Jobs?

Yung Miami explaining the chorus of *Jobs* on Genius

Lines 1-2

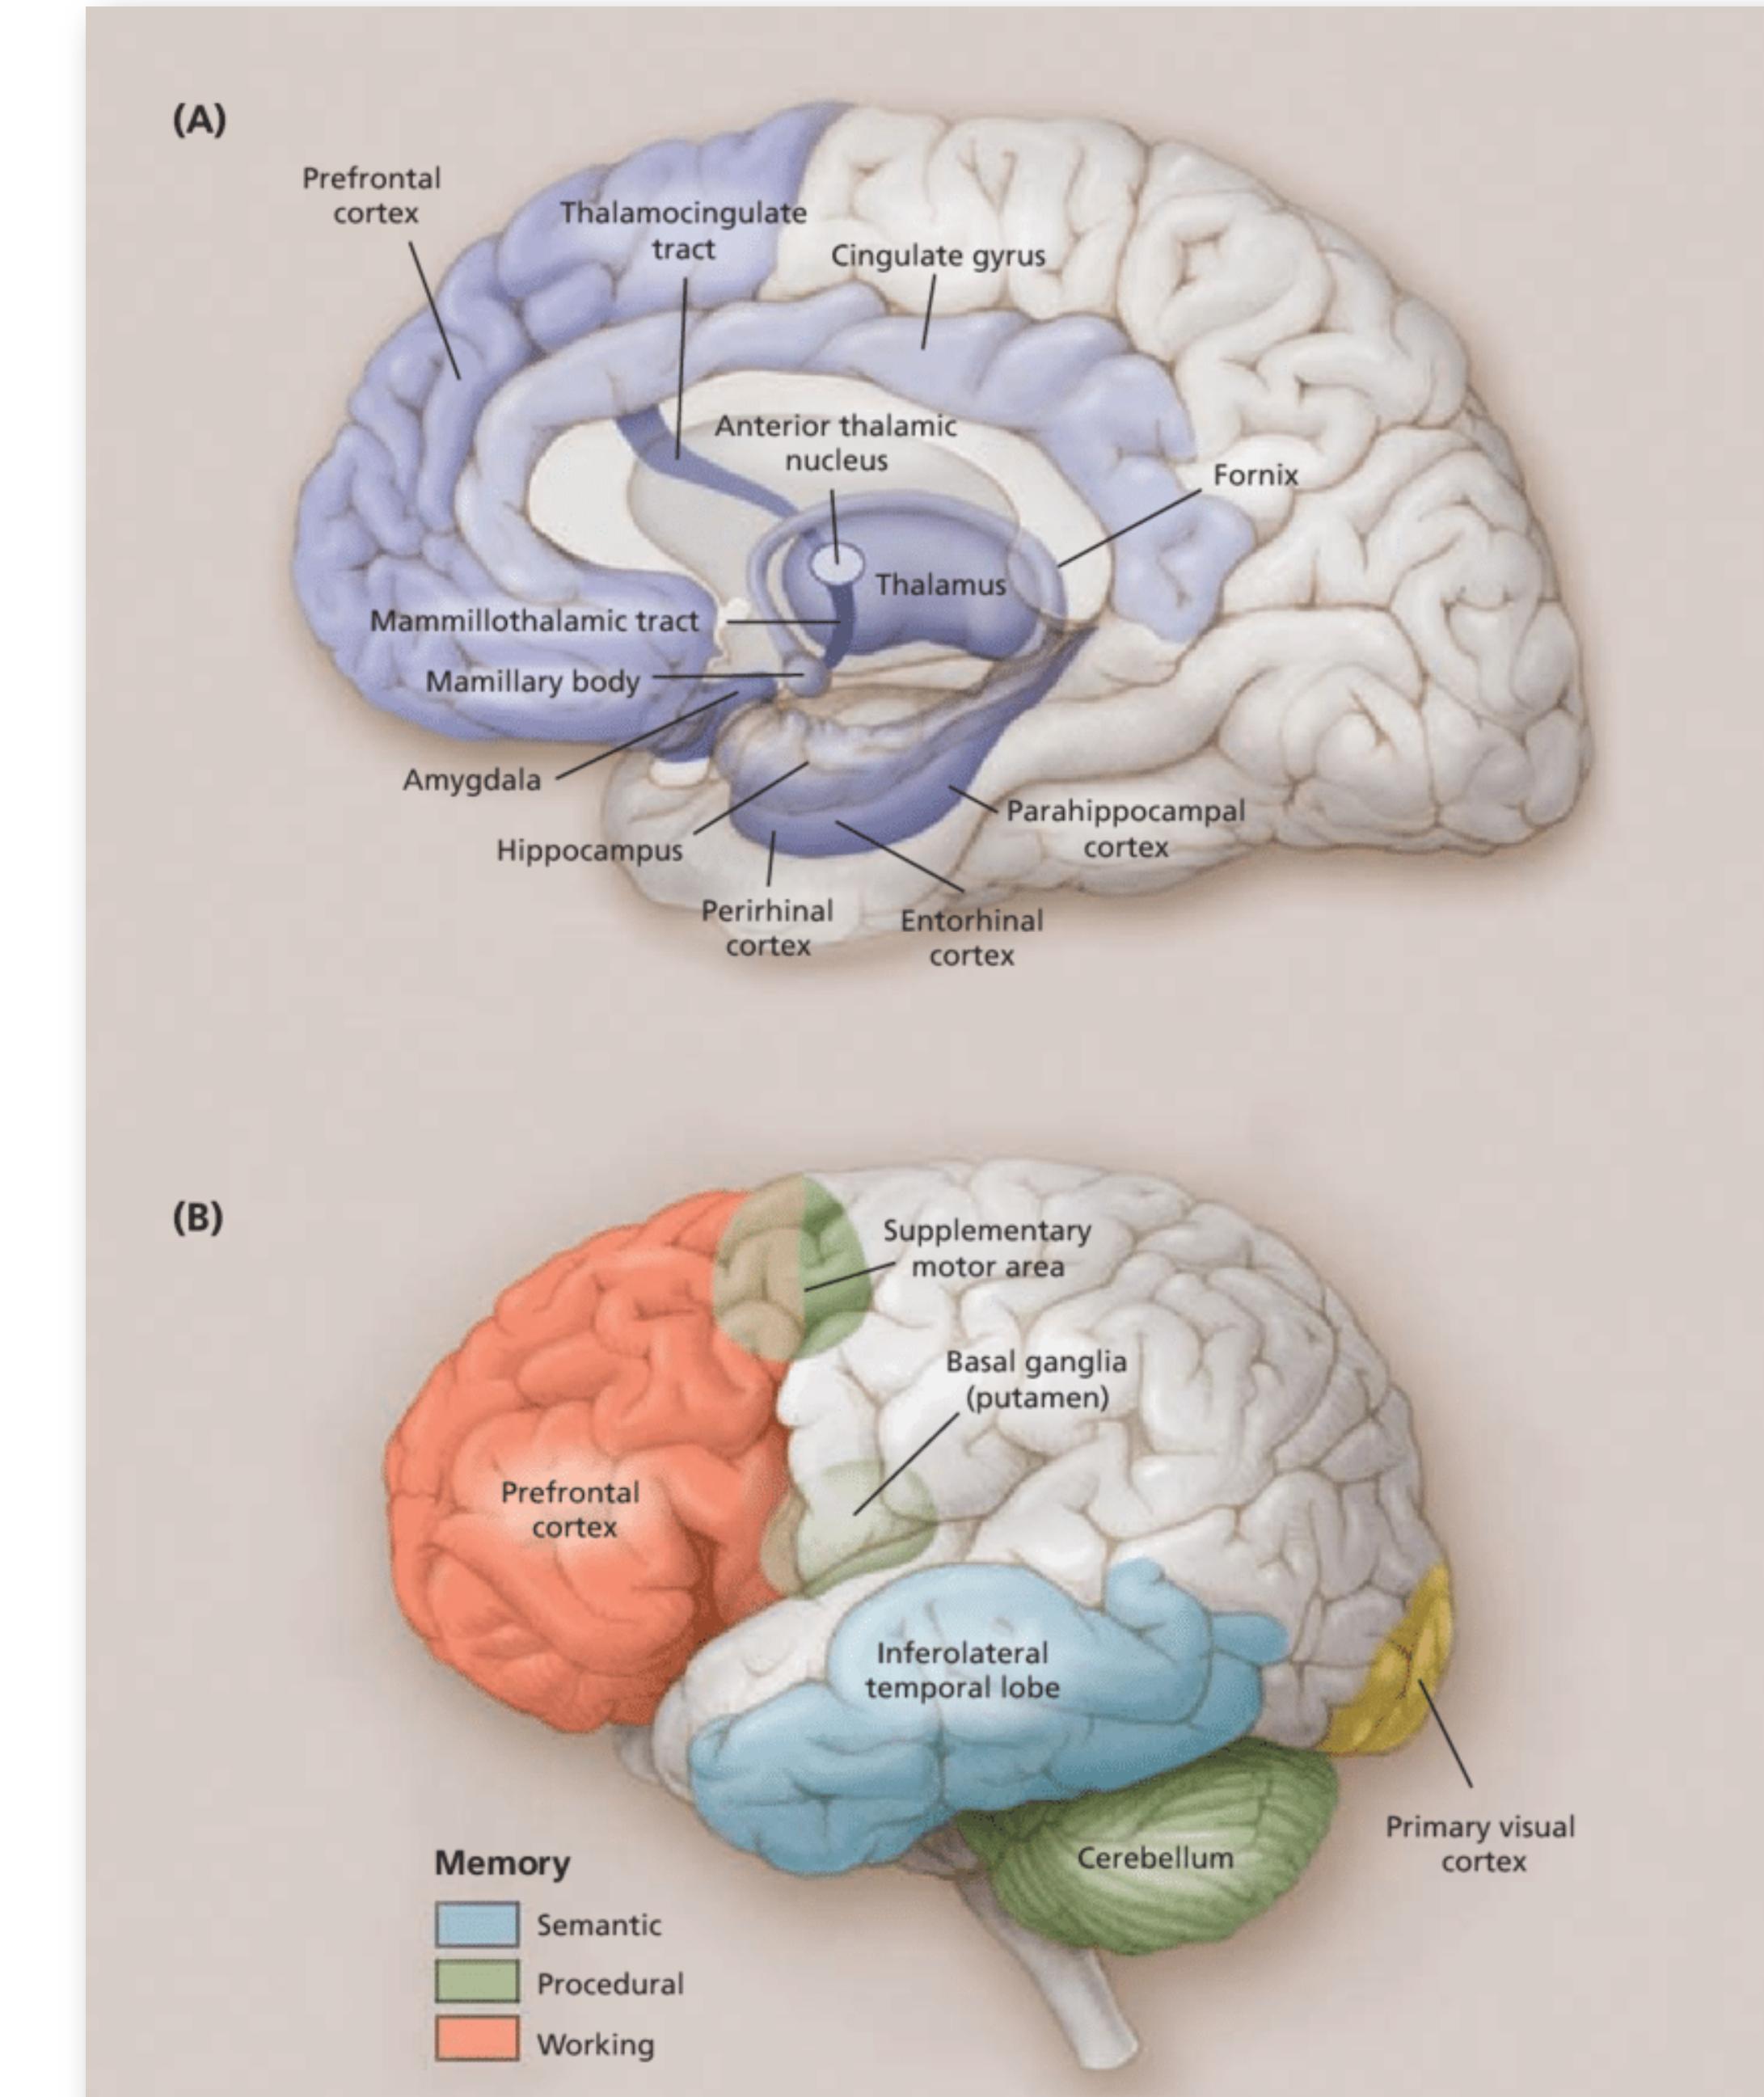

- Yung Miami uses her dancing and body to attract rich men who will pay for her bills. She commands single mothers like herself who by any means have provided for their families during this pandemic.

Lines 3-4

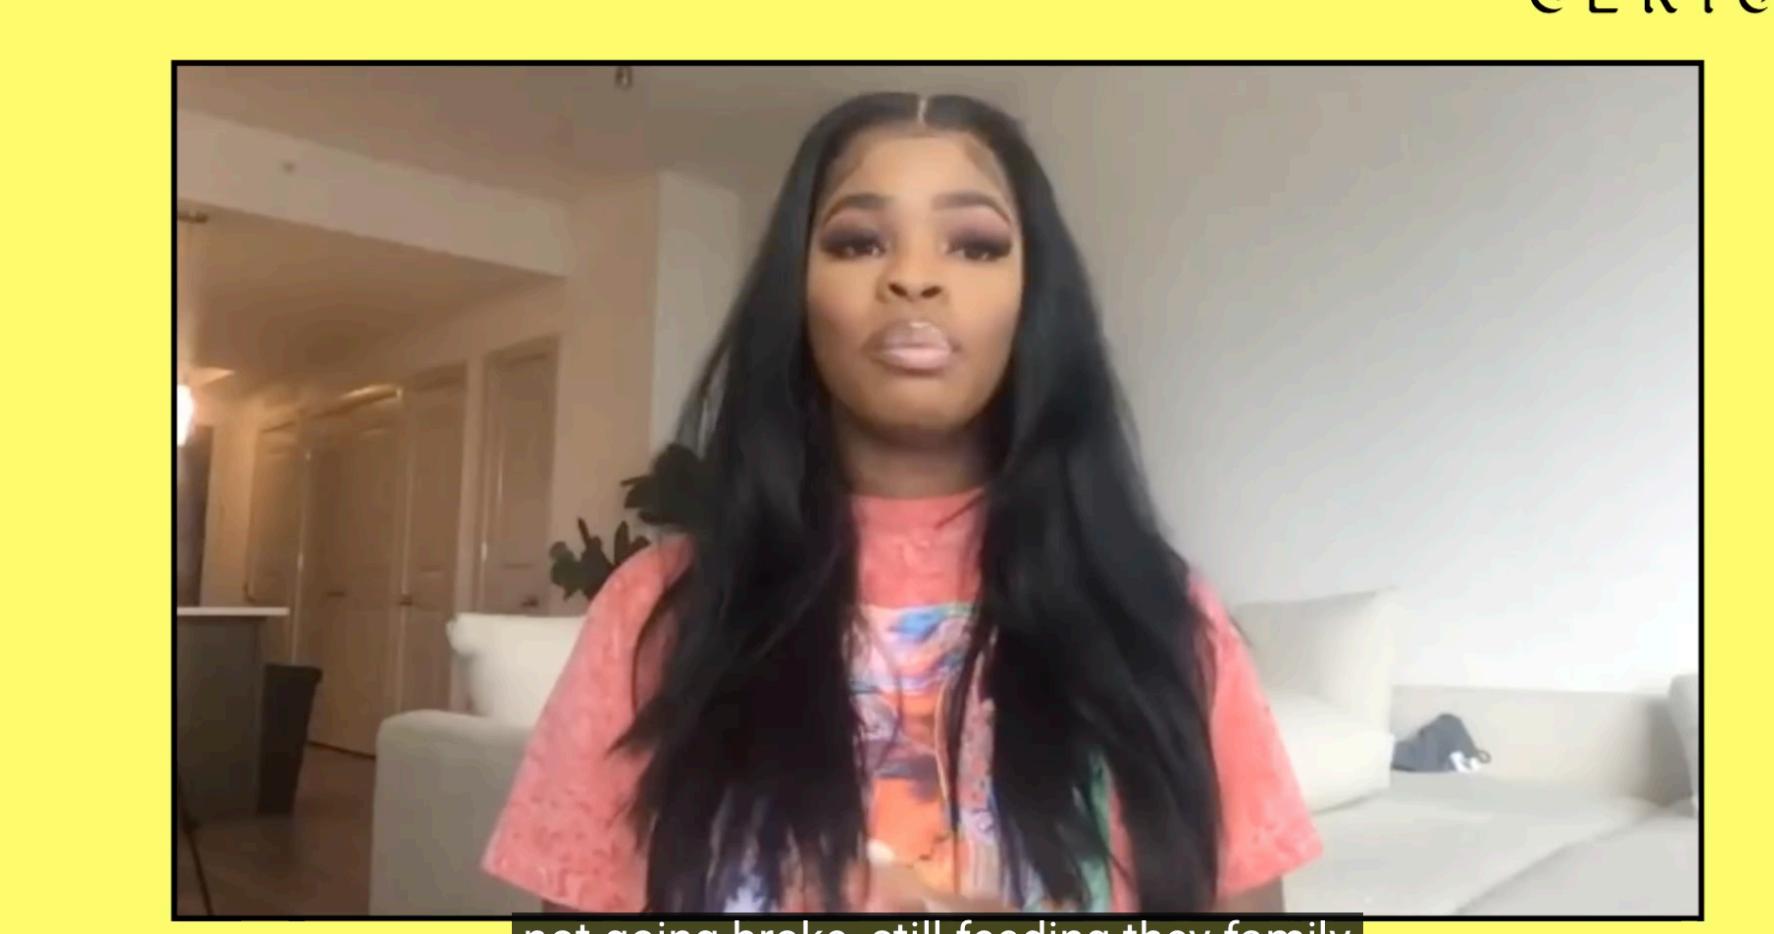

- She has always valued her freedom. She doesn't care what people think of her, if they don't like her work ethic they should just leave!

Lines 5-6

- She makes it known what she offers, but for a price.

The areas of the brain in which semantic memory is found is also the areas that react to creativity.

City Girls in their music video for *Jobs*.

Further Questions...

How can we enhance creativity?
Are just born more creative than one another?

Acknowledgments

I would like to thank Roger Beaty for the work he has done in the neuroscience field. I would also like to thank the City Girls for their contributions to the discussions about feminism, racism, and class disparities.
